

THE MALAYSIA-THAILAND BORDER JOINT GEOLOGICAL SURVEY COMMITTEE

LITHO- AND BIOSTRATIGRAPHIC CORRELATION OF CHERT BEDS IN VARIOUS ROCK UNITS ALONG THE MALAYSIA- THAILAND BORDER

The Malaysian-Thai Working Group

CONTENTS

1. INTRODUCTION
2. SIGNIFICANCE OF RADIOLARIANS
3. DISTRIBUTION OF CHERT AND OTHER RADIOLARIAN-BEARING ROCKS ALONG THE MALAYSIA-THAILAND BORDER
4. LITHOSTRATIGRAPHY
5. RADIOLARIAN BIOSTRATIGRAPHY
6. DEPOSITIONAL ENVIRONMENT OF RADIOLARIAN-BEARING ROCKS

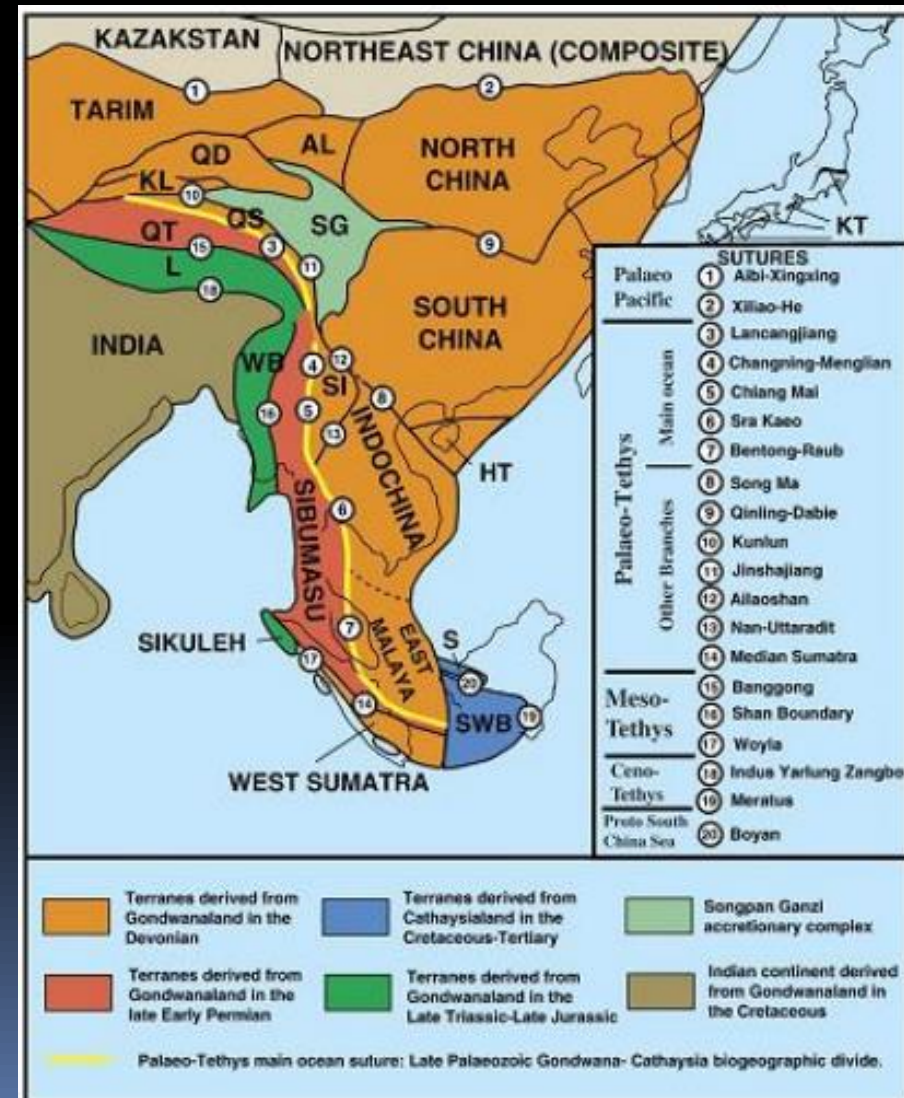

1. INTRODUCTION

(after Metcalfe, 2006)

- The continental terranes of Southeast Asia were drifted away from Gondwanaland at different times
- The developmental process of the Tethyan Ocean was divided into several stages created by rifting of continental blocks, and finally these continental blocks amalgamated to the Southeast Asian continent

1. INTRODUCTION

- Detailed biostratigraphic data of the siliceous sedimentary rocks that yield radiolarians are necessary to elucidate the tectonic development and paleogeography of Southeast Asia.
- Realizing the importance of the radiolarian in understanding the palaeogeography of this region, the MT-JGSC has agreed to undertake the study on the litho- and biostratigraphic correlation of the chert beds in various rock units along the Malaysia-Thailand border during the 7th Meeting of the Committee held in Krabi in June 2010.
- The joint study was scheduled to be carried out in two years time i.e., in the year 2011 and 2012.

2. SIGNIFICANCE OF RADIOLARIANS

- Radiolarians are planktonic protozoa that are widely distributed in the oceans, throughout the water column from the near surface to the bottom.
- They are the abundant organism record and the oldest known fossils contributing enormously to our understanding of the history of the Earth. Radiolarians (**index fossil**) provide data for palaeoecological interpretations, and they are especially useful in biostratigraphy because of their small size and abundance.
- Recently, detailed age determinations based on radiolarian biostratigraphy of pelagic, hemipelagic and continental margin sediments distributed in Southeast Asian countries have been used for terrane analysis and for understanding continental collisions and the opening and/or closing of the Palaeo-Tethys Ocean.

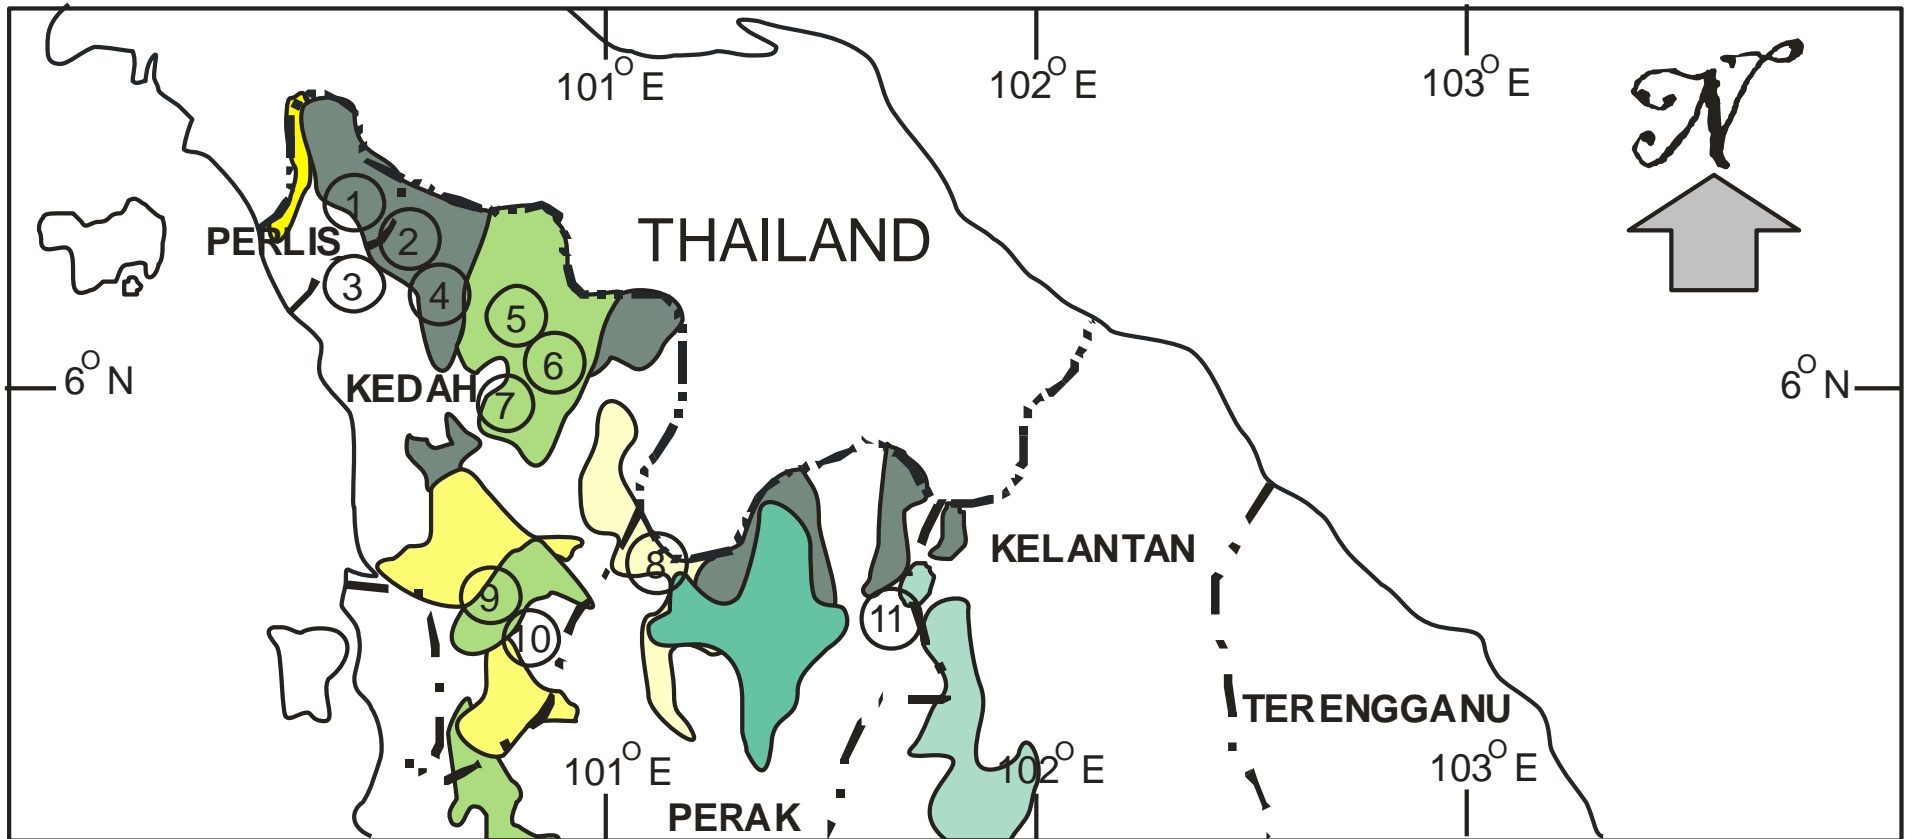

3. Distribution of chert and other radiolarian-bearing rocks along the Malaysia-Thailand Border

■ MALAYSIAN SIDE:

- the occurrences of chert had been reported in Kedah including Langkawi, in Perlis, Perak and western Kelantan
- Setul Formations – Silurian-Devonian
- Kubang Pasu Formation – Tournaisian
- Singa Formation – no radiolarian found
- Cherty unit & Gerik Formation - Permian
- Semanggol Formation –Triassic

Legend:

Semanggol Formation/Cherty unit

Mangga Formation

Gerik Formation

Kubang Pasu Formation

Mahang Formation

Setul Formation

- ① Bukit Tuntung, Pauh, Perlis
- ② Bunit Binjal, Kedah
- ③ Kodiang
- ④ Bukit Kamelong
- ⑤ Bukit Tembaga
- ⑥ Bukit Larek

- ⑦ Bukit Yoi
- ⑧ Nenering, Pengkalan Hulu, Perak
- ⑨ Merbau Pulas
- ⑩ Kuala Ketil
- ⑪ Km 73.2, E-W Highway, Perak

3. Distribution of chert and other radiolarian-bearing rocks along the Malaysia-Thailand Border

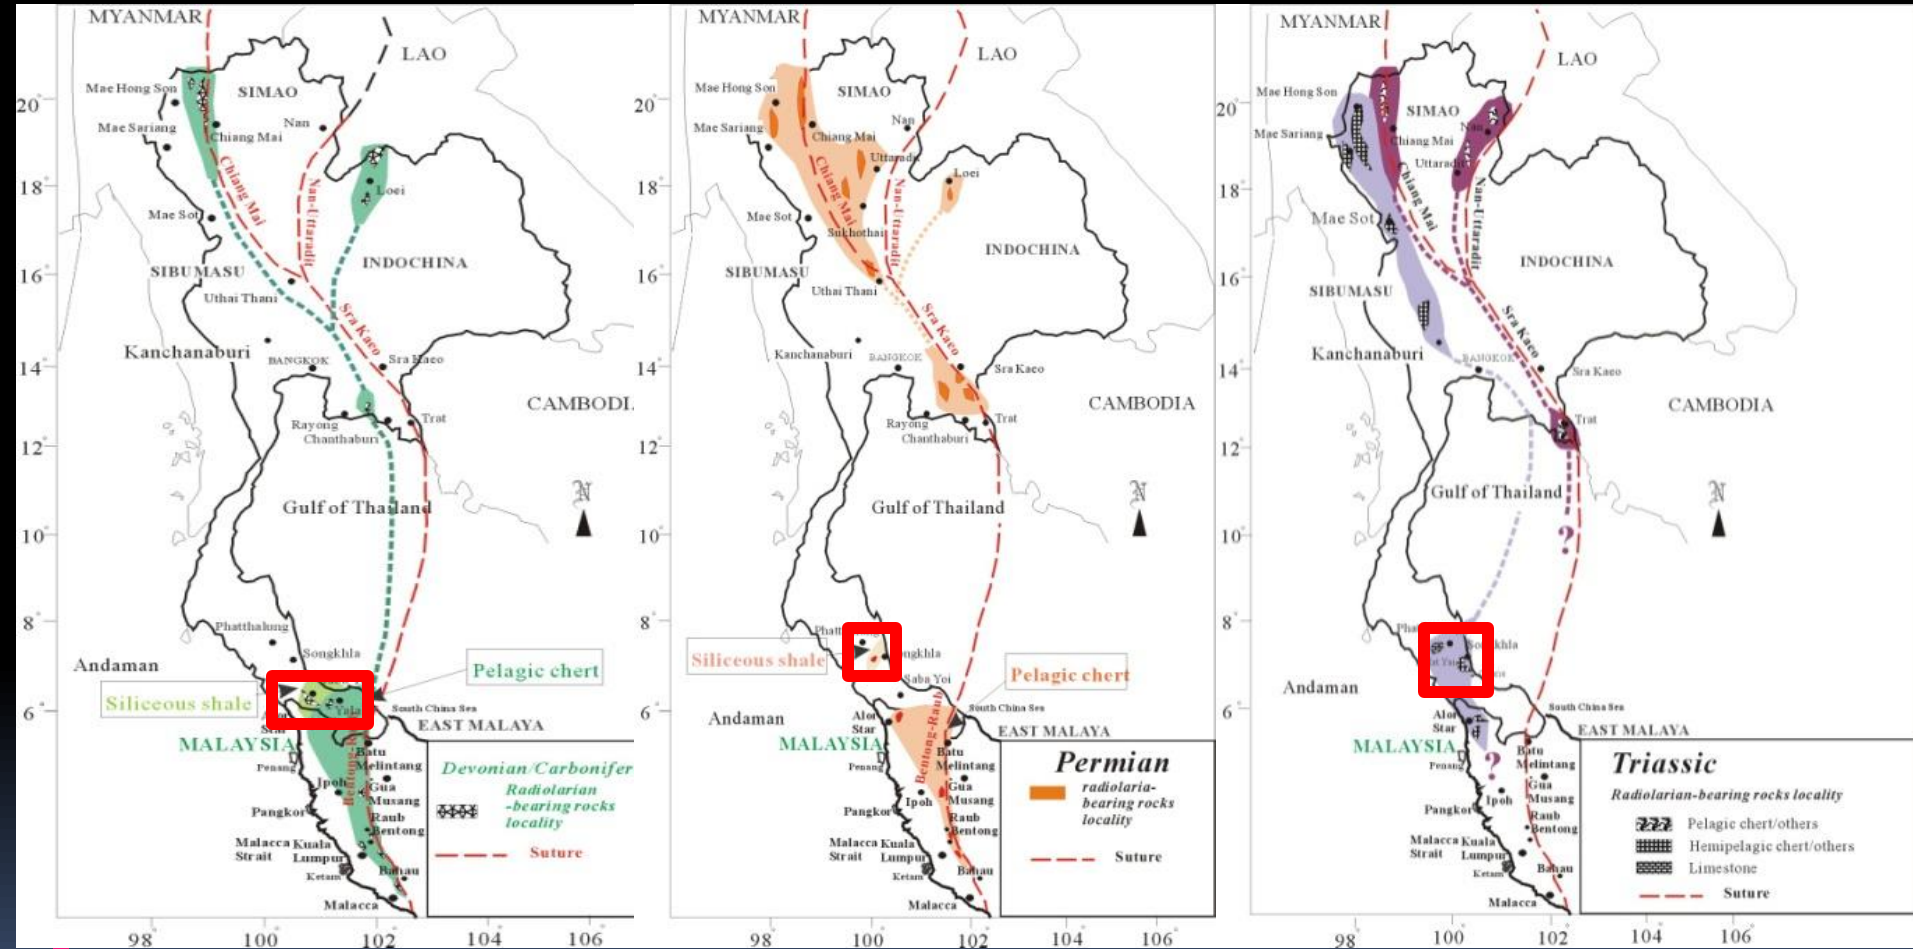

■ THAI SIDE:

- The Carboniferous to Triassic radiolarian-bearing rocks was reported from several areas of southern Thailand such as Hat Yai, Chana, Saba Yoi areas in Songkhla Province, Phatthalung Province and Yala Province.
- Yaha Formation (Carboniferous)
- Khao Phra Formation (Permian)
- Na Thawi Formation and Chaiburi Formation (Triassic).

5. RADIOLARIAN BIOSTRATIGRAPHY

- Moreover, the radiolarian faunas of these zones are similar to those of France (Gourmelon, 1987), Germany (Braun, 1990 and Braun and Schmit-Effing, 1993), southwestern China (Feng *et al.*, 1997), southern China (Wu *et al.*, 1994), Turkey (Holdsworth, 1973). Japan (e.g. Ishiga, 1990, Sugiyama, 1997), eastern Thailand (Sashida *et. al*, 1997), Oregon (Blome and Reed, 1992), and Far East of Russia (Bragin, 1991).

6. DEPOSITIONAL ENVIRONMENT OF RADIOLARIAN-BEARING ROCKS

- However, the depositional environment of the radiolarian-bearing rock sequences in Thailand and Malaysia are still debatable. The study of lithostratigraphy and radiolarian biostratigraphy of radiolarian-bearing rocks is very important in elucidating **the depositional environment and tectonic development** of the Palaeozoic and Mesozoic in Thailand and Malaysia. Further work is required to resolve this issue.
